version 2019-04

Simple Circuit

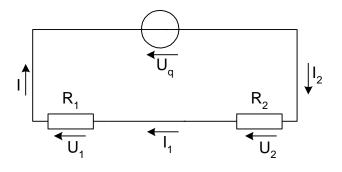

electrical voltage U	$U=\phi_1-\phi_2$	Φ1	electrical potential of point 1
electrical current I	$I = \frac{dQ}{dt}$ under the condition of a stationary current (I = constant) apply to: $I = \frac{Q}{t}$	Q	electrical potential of point 2 electric charge time
current density S	$S = \frac{I}{A}$	 	- U <sub>0</sub>
electrical resistor R	$R = \frac{U}{I}$		R ↓
electrical conductance G	$G = \frac{1}{R}$		
electrical power P	$P = U \cdot I$		C C
electrical work W	$W = P \cdot t$	$U_0$	voltage of the voltage source
OHM`s law	under the condition $\vartheta = \text{constant apply to:}$ $U \sim I, \frac{U}{I} = \text{constant}$		
assessment of resistor	under the condition $\vartheta = \text{constant apply to:}$ $R = \frac{\rho \cdot 1}{A}$		
electrical conductivity $\gamma(\kappa)$	$\gamma = \frac{1}{\rho}$	ρ	temperature specific electrical resistance length of the conductor
influence of the temperature on the electrical resistor	$\Delta \mathbf{R} = \alpha \cdot \mathbf{R}_{20} \cdot \Delta \vartheta \text{ with } \Delta \vartheta = \vartheta - 20^{\circ} \mathbf{C}$ $\mathbf{R}_{\vartheta} = \mathbf{R}_{20} (1 + \alpha \cdot \Delta \vartheta)$	A R <sub>9</sub> R <sub>20</sub>	resistor by 20 °C temperature coefficient
		~	en portante eserificient

### **Direct current circuits**

F

#### Series connection of resistors

 $^+$ 

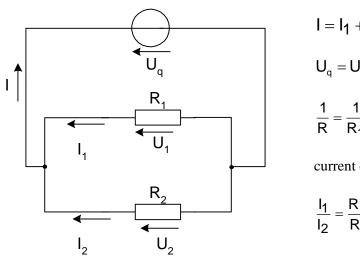

$$I = I_1 = I_2 = ... = I_n$$
  
 $U_q = U_1 + U_2 + ...U_n$   
 $R = R_1 + R_2 + ...R_n$ 

potential divider rule:

$$\frac{U_1}{U_2} = \frac{R_1}{R_2} \qquad \qquad \frac{U_1}{U_q} = \frac{R_1}{R}$$

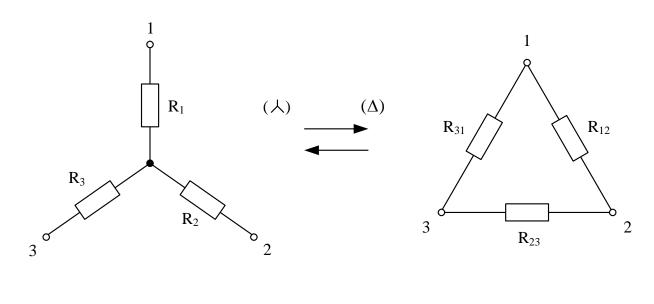

Parallel connection of resistors

 $I = I_{1} + I_{2} + \dots + I_{n}$   $U_{q} = U_{1} = U_{2} = \dots = U_{n}$   $\frac{1}{R} = \frac{1}{R_{1}} + \frac{1}{R_{2}} + \dots + \frac{1}{R_{n}}$ current divider rule:

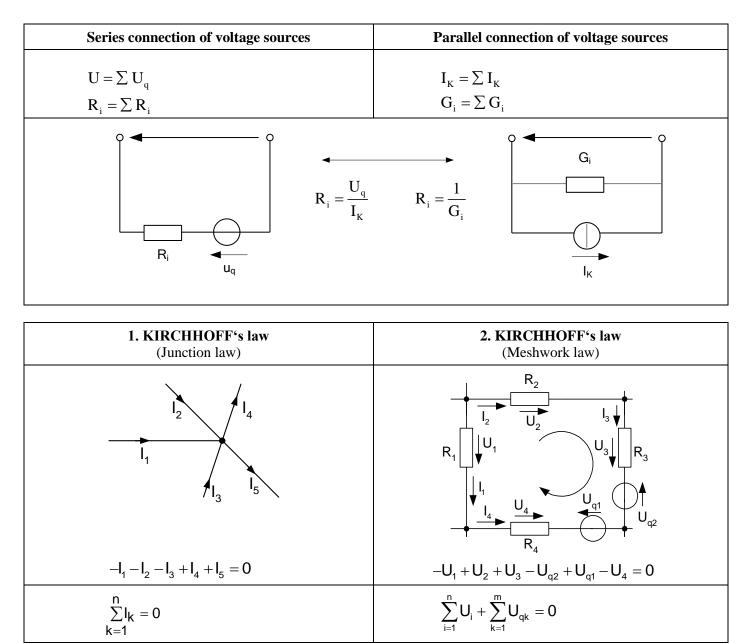

$$\frac{l_1}{l_2} = \frac{R_2}{R_1}$$
  $\frac{l_1}{l} = \frac{R}{R_1}$ 

Network transformation

$$\frac{Transformation}{R_{12} = R_1 + R_2 + \frac{R_1 R_2}{R_3}}$$
$$R_{23} = R_2 + R_3 + \frac{R_2 R_3}{R_1}$$
$$R_{31} = R_3 + R_1 + \frac{R_3 R_1}{R_2}$$

#### Electrical field

C

electrical charge Q	$Q = N \cdot e$ $Q = \int_{t_1}^{t} I(t) dt$	<ul> <li>N number of electrones</li> <li>e elementary charge ( p. 14 )</li> <li>I current intensity</li> <li>t time</li> <li>F force</li> </ul>
COULOMB's law	for point charces, apply to: $F = \frac{1}{4\pi \cdot \varepsilon_0 \cdot \varepsilon_r}  \frac{Q_1 \cdot Q_2}{r^2}$	$ \begin{array}{ll} F & \text{force} \\ \epsilon_0 & \text{permitivity (vacuum) (p. 14)} \\ \epsilon_r & \text{dielectric constant} \\ r & \text{distance between the point charges} \end{array} $
electrical field strength E	$\vec{E} = \frac{\vec{F}}{Q}$ for homogeneous electric field, apply to: $E = \frac{U}{s}$	$\begin{array}{c c} Q_1 & \overline{F_1} & \overline{F_2} & Q_2 \\ \hline & & r \\ s & \text{distance between the points, which have the voltage drop U} \end{array}$
electrical flux density D	$\vec{D} = \varepsilon_0 \cdot \varepsilon_r \cdot \vec{E}$ for vacuum apply to: $\varepsilon_r = 1$	
dielectric constant ɛ	$\epsilon = \epsilon_0 \cdot \epsilon_r$	
electrical flux Ψ	$\Psi = \int \vec{D} d\vec{A}$ under the condition $\vec{D} = \text{constant und } \vec{D} \parallel \vec{A}$ apply to: $\Psi = D \cdot A$	A area
electrical potential $\phi$	$\varphi = \frac{W}{Q} \qquad \varphi = \int_{P_0}^{P_1} \vec{E}(s)  d\vec{s}$	P <sub>1</sub> • P <sub>2</sub>
electrical voltage U	$U = \phi_1 - \phi_2 \qquad U = \int_{P_2}^{P_1} \vec{E}(s) d\vec{s}$ for homogeneous field, apply to: $U = \vec{E} \cdot \vec{s}$	<ul> <li>W dislocation work on a charge Q in the electrical field</li> <li>φ<sub>1</sub> electrical potential in point P<sub>1</sub></li> <li>φ<sub>2</sub> electrical potential in point P<sub>2</sub></li> <li>s distance</li> </ul>

**Capacitors** 

capacitance C of an capacitor	$C = \frac{Q}{U}$			
breakdown strength E <sub>d</sub>	$E_d = \frac{U}{d}$			
electrical strength of field E of an plate capacitor	$E = \frac{U}{d}$			- + dielectric
capacitance C of an plate capacitor	$\mathbf{C} = \boldsymbol{\varepsilon}_0 \cdot \boldsymbol{\varepsilon}_r \cdot \boldsymbol{\varepsilon}_r$	$\frac{A}{d}$	Q U	charge voltage
capacitance C of an zylindrical capacitor	$C = \frac{2\pi \cdot \varepsilon_0}{\ell n}$	$\frac{\mathbf{\epsilon}_{r} \cdot \ell}{\frac{r_{a}}{r_{i}}}$	d ε <sub>0</sub> ε <sub>r</sub> Α	distance between the plates permittivity (vacuum) (p. 14) dielectric constant area
energy E of the electric field (plate capacitor)	$E = \frac{1}{2}C\cdotU^2$	2		
charge of an capacitor	$U_{C} = U \cdot \left(1\right)$ $I = I_{0} \cdot e^{-1}$	$-e^{\left(-\frac{t}{R\cdot C}\right)}$ $\frac{t}{R\cdot C}$	U <sub>C</sub> U R C t I I I <sub>0</sub> e	capacitor-voltage charging voltage OHM's resistor capacitor time current intensity current intensity (t = 0) EULER's number
discharge of an capacitor	$U_{C} = U \cdot e^{\left( -\frac{1}{2} \right)}$ $I = I_{0} \cdot e^{\left( -\frac{1}{2} \right)}$			
time constant $\tau$	$\tau = R \cdot C$			
Series connection of capacitors		Р	arallel cor	nnection of capacitors
$C_1 C_2$		_		

 $\frac{1}{U_{1}} \qquad \underbrace{U_{2}}_{U_{2}}$   $\frac{1}{C} = \frac{1}{C_{1}} + \frac{1}{C_{2}} + \dots + \frac{1}{C_{n}}$   $U = U_{1} + U_{2} + \dots + U_{n}$   $U = U_{1} = U_{2} = \dots = U_{n}$ 

6

#### Magnetic field

magnetic strength of field H	for the field outside of an direct conductor with the current I, apply to:	I current density r distance from conductor
	$H = \frac{I}{2\pi r}$ $H = \frac{I}{4\pi \cdot r} (\cos \alpha_1 - \cos \alpha_2)$ for the field inside of an long coil with the current I, apply to: $H = \frac{N \cdot I}{1}$ for homogeneous magnetic field, apply to:	+ + + + + + + + + + + + + + + + + + +
	$H = \frac{\Theta}{s} \rightarrow \frac{\Theta}{s}$	N winding number of the coil 1 length of the coil
magnetic flux density B (magnetic induction)	$\vec{B} = \mu_0 \cdot \mu_r \cdot \vec{H}$	
permeability µ	$\mu = \mu_0 \cdot \mu_r$ for vacuum, apply to: $\mu_r = 1$	
magnetic flux Φ	$\Phi = \int \vec{B}  d\vec{A}$ for $\vec{B}$ = constant	
	and $\vec{B} \parallel \vec{A}$ apply to: $\Phi = B \cdot A$	$\Theta$ magnetomotive force s circle of an area $\mu_0$ permittivity (vacuum, p.14)
magnetic Voltage V	$V = \int_{P_2}^{P_2} \vec{H}(s) d\vec{s}$	μ <sub>r</sub> permeability A area
	under the condition of homogeneous field, apply to: $V = \vec{H} \cdot \vec{s}$	
magnetic resistor R <sub>m</sub>	$R_{m} = \frac{1}{\mu_{0} \cdot \mu_{r} \cdot A}$ $R_{m} = \frac{V}{\Phi}$	s distance
	$\vec{F}_{L} = Q \cdot \vec{v} \times \vec{B}$	l lenght A area
force of an moved electron $F_L$	under the condition $\vec{v} \perp \vec{B}$ apply to:	Q charge v speed
(LORENTZ's force)	$F_{L} = Q \cdot v \cdot B$	1 length of the conductor
force F to a conductor	$\vec{F} = 1 \cdot \vec{I} \times \vec{B}$	]
with current I	under the condition $\vec{I} \perp \vec{B}$ apply to:	F F
	F=1·I·B	$+ \varphi$ $1$ $\overline{1} \varphi$ $-$
energy E of the magnetic field of a coil with current I	$E = \frac{1}{2}L \cdot I^2$	
		L inductivity of the coil
		<u> </u>

#### **Electromagnetic field**

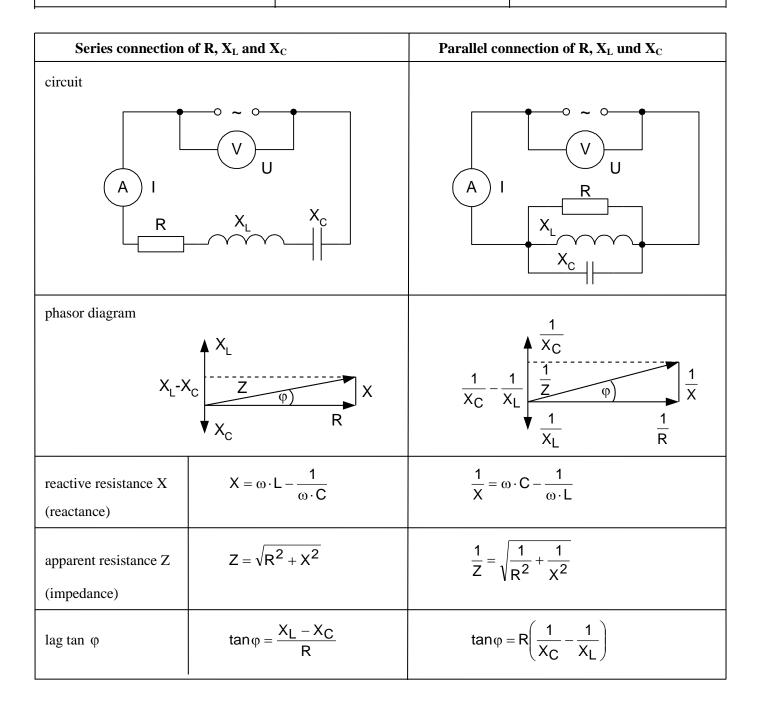

Induction law	$\begin{aligned} u_{iq} &= \frac{d\Phi}{dt} \\ \text{under the condition of steady change} \\ \text{of the magnetic field and } \vec{B} \perp \vec{A} \\ \text{for a coil, apply to:} \\ u_{iq} &= N \frac{\Delta (B \cdot A)}{\Delta t} \\ \text{for an moved conductor } \vec{v} \perp \vec{B} \text{ apply to:} \\ u_{iq} &= v \cdot B \cdot \ell \end{aligned}$	U <sub>i</sub> induced voltage $\Phi$ magnetic flux N number of windings t time B magnetic flux density A area $\vec{B}$
self-induced voltage in a coil inductivity L of an coil	$u = L \cdot \frac{dI}{dt}$ under the condition of steady change of the current, apply to: $u = L \cdot \frac{\Delta I}{\Delta t}$ for an long coil, apply to: $L = \frac{\mu_0 \cdot \mu_r \cdot N^2 \cdot A}{L}$	v speed of the conductor l length of the conductor or the coil $\vec{B}$ I current intensity $\mu_0$ permittivity (vacuum, p.14) $\mu_r$ permeability A area

#### Alternating current circuit

current i in alternating current circuit	momentary value: $i = \hat{I} \cdot \sin(\omega \cdot t + \phi_0)$ root-mean-square value: $I = \frac{1}{\sqrt{2}} \hat{i} \approx 0,7 \hat{i}$	<ul> <li>ω angular frequency</li> <li>i momentary value</li> <li>t time</li> <li>i peak value</li> <li>I root-mean-square value</li> </ul>
voltage u in alternating current circuit	momentary value: $u = \hat{u} \cdot \cos(\omega t + \phi_0)$ root-mean-square value: $U = \frac{1}{\sqrt{2}}\hat{u} \approx 0.7 \hat{u}$	
apparent power S	$S = U \cdot I$	
effective power P	$P = U \cdot I \cdot \cos \varphi$	$\cos \phi$ power factor $\phi$ lag angle
reactive power Q	$Q = U \cdot I \cdot \sin \phi$	ψ iag angle

#### **Resistors in alternating current circuit**

OHM's resistor R R = $\frac{U}{I}$	resistance of inductivity $X_L$ $X_L = \frac{U}{I}$	resistance of capacitor $X_C$ $X_C = \frac{U}{I}$
for a metallic conductor under the condition $\vartheta$ = constant, apply to:	for a coil, apply to:	for a capacitor, apply to:
$R = \frac{\rho \cdot l}{A}$	$X_L = \omega \cdot L$	$X_{C} = \frac{1}{\omega \cdot C}$
		u,i t u,i t

#### **Transformation**

voltage transformation for an transformer without losses	under the condition $I_2 \rightarrow 0$ (no-load), apply to: $\frac{U_1}{U_2} = \frac{N_1}{N_2}$	$A I_1 V U_1 N_1$
current transformation for an transformer without losses	under the condition $I_2 \rightarrow \infty$ (short), apply to: $\frac{I_1}{I_2} = \frac{N_2}{N_1}$	
transformation ratio ü	$\ddot{u} = \frac{N_1}{N_2}$	U voltage
power transformation	$\begin{split} P_1 &= P_2 + P_V \\ U_1 \cdot I_1 \cdot \cos \varphi_1 &= U_2 \cdot I_2 \cdot \cos \varphi_2 + P_V \\ \text{under the conditions of heavy load,} \\ \text{without losses and } \varphi_1 &= \varphi_2 \text{ apply to:} \\ U_1 \cdot I_1 &= U_2 \cdot I_2 \end{split}$	I current N number of windings P power $P_v$ power loss $\phi$ lag angle between current and voltage
effectiveness η of an transformer	$\eta = \frac{P_{out}}{P_{in}}$	P <sub>out</sub> power output P <sub>in</sub> power input

### **Electromagnetic oscillation**

THOMSON's oszillation law frequency f of an electrical oscillating circuit (without attenuation)	$T = 2\pi \cdot \sqrt{L \cdot C}$ under the condition of a free oscillation without attenuation (R=0), apply to: $f = \frac{1}{2\pi\sqrt{L \cdot C}}$	T period L inductivity C capacity
natural frequency f of an electrical oscillating circuit (with attenuation)	under the condition of a free oscillation, apply to: $f = \frac{1}{2\pi} \sqrt{\frac{1}{L \cdot C} - \frac{R^2}{L^2}}$	R OHM's resistor L inductivity C capacity C R
damping coefficient $\delta$	$\delta = \frac{R}{2L}$	$f \qquad natural frequency \\ f_e \qquad exciter frequency$
resonance condition	f = f <sub>e</sub>	

#### **Characteristics and units**

characteristik	symbol	unit		Conversion b units	etween the
damping coefficient	δ	per second	s <sup>-1</sup>	$1s^{-1}$	$= 60 \text{ min}^{-1}$
work	W, A	joule newtonmeter watt-second kilowatt-hour	J N $\cdot$ m W $\cdot$ s kW $\cdot$ h	1 J 1 kW · h	$= 1 \text{ kg} \cdot \text{m}^2 \cdot \text{s}^{-2}$ $= 1 \text{ N} \cdot \text{m}$ $= 1 \text{ W} \cdot \text{s}$ $= 3.6 \cdot 10^6 \text{ W} \cdot \text{s}$
illuminance	Е	lux	lx	1 lx	$= 1 \operatorname{lm} \cdot \operatorname{m}^{-2}$
acceleration	a, g	meter per square-second	$\mathbf{m} \cdot \mathbf{s}^{-2}$	$1 \text{ m} \cdot \text{s}^{-2}$	$= 1 \mathrm{N} \cdot \mathrm{kg}^{-1}$
reactive power	Q	voltampere reactive	VAr	1 VAr	= 1 var
density (of aggregate)	ρ	kilogramme per cubic meter gramme per cubic centimeter	$kg \cdot m^{-3}$ $g \cdot cm^{-3}$	$1 \text{ kg} \cdot \text{m}^{-3}$ $1 \text{ g} \cdot \text{cm}^{-3}$	$= 10^{-3} g \cdot cm^{-3}$ = 10 <sup>3</sup> kg \cdot m^{-3}
torque	М	newtonmeter	$N \cdot m$	$1 \text{ N} \cdot \text{m}$	$= 1 \text{ kg} \cdot \text{m}^2 \cdot \text{s}^{-2}$
speed (rate of revolutions)	n	per second	s <sup>-1</sup>	1 s <sup>-1</sup>	$= 60 \text{ min}^{-1}$
magnetomotive force	Θ	ampere	А
